Modified Peptides as Therapeutic Agents

Abstract

- The present invention concerns fusion of Fc domains with biologically active peptides and a process for preparing pharmaceutical agents using biologically active peptides. In this invention, pharmacologically active compounds are prepared by a process comprising:
- a) selecting at least one peptide that modulates the activity of a protein of interest; and
 - b) preparing a pharmacologic agent comprising an Fc domain covalently linked to at least one amino acid of the selected peptide.
- 15 Linkage to the vehicle increases the half-life of the peptide, which otherwise would be quickly degraded <u>in vivo</u>. The preferred vehicle is an Fc domain. The peptide can be selected, for example, by phage display, <u>E. coli</u> display, ribosome display, RNA-peptide screening, yeast-based screening, chemical-peptide screening, rational design, or protein
- 20 structural analysis.
